From Small to Very Large

The waves are the smallest things. They create particles merging. These particles fuse into a Higgs Boson to create an atom. Atoms combine into molecules.

Comes the life. DNA is created by the soul's waves and runs through the soul's waves to create tissues and organs. Every organ has a soul.

Our body has a short lifespan. So its speed is slow. The earth has a longer lifespan. So its speed is faster. A soul makes the planets stand around the sun.

Our galaxy, the Milky Way, has a longer lifespan. Galaxies hold thanks to a soul. Galaxy's speed is even faster. The universe still has a faster speed. Thus life was able to be born with infinite speed. Life makes it possible to regulate time.

My Notes

Write about matter and life.
