What is a Black Hole ?

Light is both a particle and a wave. So light is attracted by gravity. A black hole is so massive that it even attracts light. So we wouldn't see anything coming out of the black hole. That's why we see a black hole in relation to its environment. But it was detected that black holes emit a lot of light.

There is a black hole in every galaxy's center. But the black hole is only a galaxy matter's tiny part.

As matter is created, it is possible that black holes will explode. Indeed, the accumulated matter should create stars.

My Notes

Write about the Milky Way's black hole.
